**APPORTIONMENT PERIOD  
FOR EASTWARD FLOWING STREAMS CROSSING  
THE SASKATCHEWAN-MANITOBA BOUNDARY**

**BACKGROUND**

The Master Agreement on Apportionment states in Section 3 of Schedule A that the apportionment period between Alberta and Saskatchewan shall be the calendar year. Similarly, Section 3 of Schedule B specifies that the apportionment period between Saskatchewan and Manitoba is the period from April 1st of each year to March 31 of the year following (hereafter referred as Water Year).

Questions were raised on several occasions as to why different apportionment time periods were specified in Schedules A and B of the agreement. This matter was discussed at the Prairie Provinces Water Board (Old Board Meeting No. 41 held on July 14, 1969), Minute 41-05 recorded that

*"...Mr. Clark asked why it was necessary in the provincial agreements, to base apportionment between Alberta and Saskatchewan on the calendar year, and between Saskatchewan and Manitoba on the water year. In his opinion, the elected time base in apportioning streamflows is important, and he could foresee difficulties in administering the agreement. Mr. Weber noted that Manitoba needs were established on the basis of hydro flow requirements and this is the reason why the water year was adopted in the Saskatchewan-Manitoba agreement. Mr. Crook noted that the Board is considering an agreement between Alberta, Saskatchewan and Manitoba on the principles of apportionment. The agreement states what the provinces want. It is realized that technical problems do exist as was stated before, however, technical problems are not immune to solution. Mr. Bailey added that technical and other administrative problems could be resolved through mutual consent and cooperation".*

After the signing of the Master Agreement on Apportionment on October 30, 1969, apportionment monitoring for eastward flowing interprovincial streams have been administered based on the apportionment period specified in the Agreement.

In April 1980, the Committee on Hydrology completed a report entitled "Report on Administration of the Apportionment Agreement, April 1980" (PPWB Report #58). Chapter 4 of that report provides an overview on apportionment, balance and audit periods for each of the five major interprovincial streams (i.e. North Saskatchewan, South Saskatchewan, Saskatchewan, Churchill and Qu'Appelle Rivers). The COH recommended that the apportionment period continue to be reported for the calendar year, as defined in Schedule A, and for the twelve-month period of April 1st to March 31st of the following year as defined in Schedule B of the 1969 agreement (Re: Recommendation Chapter and the report's covering letter).

In recent years, concerns were raised regarding the continuing use of water year for apportioning the waters of eastward flowing streams crossing the Saskatchewan-Manitoba boundary, particularly on the suitability of a water year and its effects on apportionment monitoring and reporting.

## **DISADVANTAGE OF APPORTIONING THE WATER BASED ON WATER YEAR**

From a hydrologic point of view, the frequency, magnitude, and spring runoff period for a stream varies from year to year.

The time period in which flow apportionment is accounted for is relatively important particularly for those small interprovincial streams. Most of the spring runoff in the prairie provinces occurred during the period of March to June. An apportionment period based on the calendar year would cover all the spring runoff while an apportionment period based on the water year may encounter one of the following cases:

1. Spring runoff may be spread over the two consecutive apportionment periods.
2. Having two spring runoffs in one apportionment period, and
3. Having little or no spring runoff in one apportionment period.

The data format for streamflow records published by Environment Canada is based on the calendar year rather than the water year. Although some computer programs are used to change the data format from calendar year to water year, it would be easier to use the data in its original format.

## **CONSIDERATIONS FOR SWITCHING THE APPORTIONMENT PERIOD FROM WATER YEAR TO CALENDAR YEAR**

Before considering the possibility of changing the apportionment period from water year to calendar year, several items pertinent to the apportionment period must be addressed. They are discussed in the following sections:

### **Consideration 1: Flow Required by Manitoba Hydro**

When Schedule B of the Master Agreement was negotiated in 1969, between Manitoba and Saskatchewan, hydropower flow requirements for major interprovincial streams (e.g. Saskatchewan River) were considered. A review of the historical flow records of the Saskatchewan River suggests that the same flow pattern would likely be continued despite the apportionment period used ( e.g. calendar or water year) (see Figures 1 to 6). However, it would be up to Manitoba and Saskatchewan to decide whether such a change in the flow apportionment is suitable for their operation.

### **Consideration 2: PPWB Annual Report**

If the calendar year is used for apportionment monitoring of streams crossing the Saskatchewan-Manitoba boundary, apportionment calculation for selected interprovincial streams could be completed earlier. However, this does not mean the PPWB Annual Report can be published three months earlier (e.g. in June of each year instead of in September) because most of the "final" hydrometric records (e.g. South Saskatchewan River) and the financial statement are not likely to be available by June of each year.

### **Consideration 3: The Effect on Annual Apportionment Volume**

Switching the apportionment period from water year to calendar year will definitely affect the 'annual' volume of apportionment flow. An evaluation of the recorded and natural flow (or apportionment flow) for the Saskatchewan River, Churchill River and Qu'Appelle River show that the effect is insignificant for most of the cases (See Figures 1 to 6). However, it is interesting to note that, based on the water year, the Qu'Appelle River annual natural flow for 1989-90 was 19 053 dam<sup>3</sup>. If the apportionment is based on the calendar year, annual natural flow for 1989 was only 91 dam<sup>3</sup> (see Tables 6 and 8).

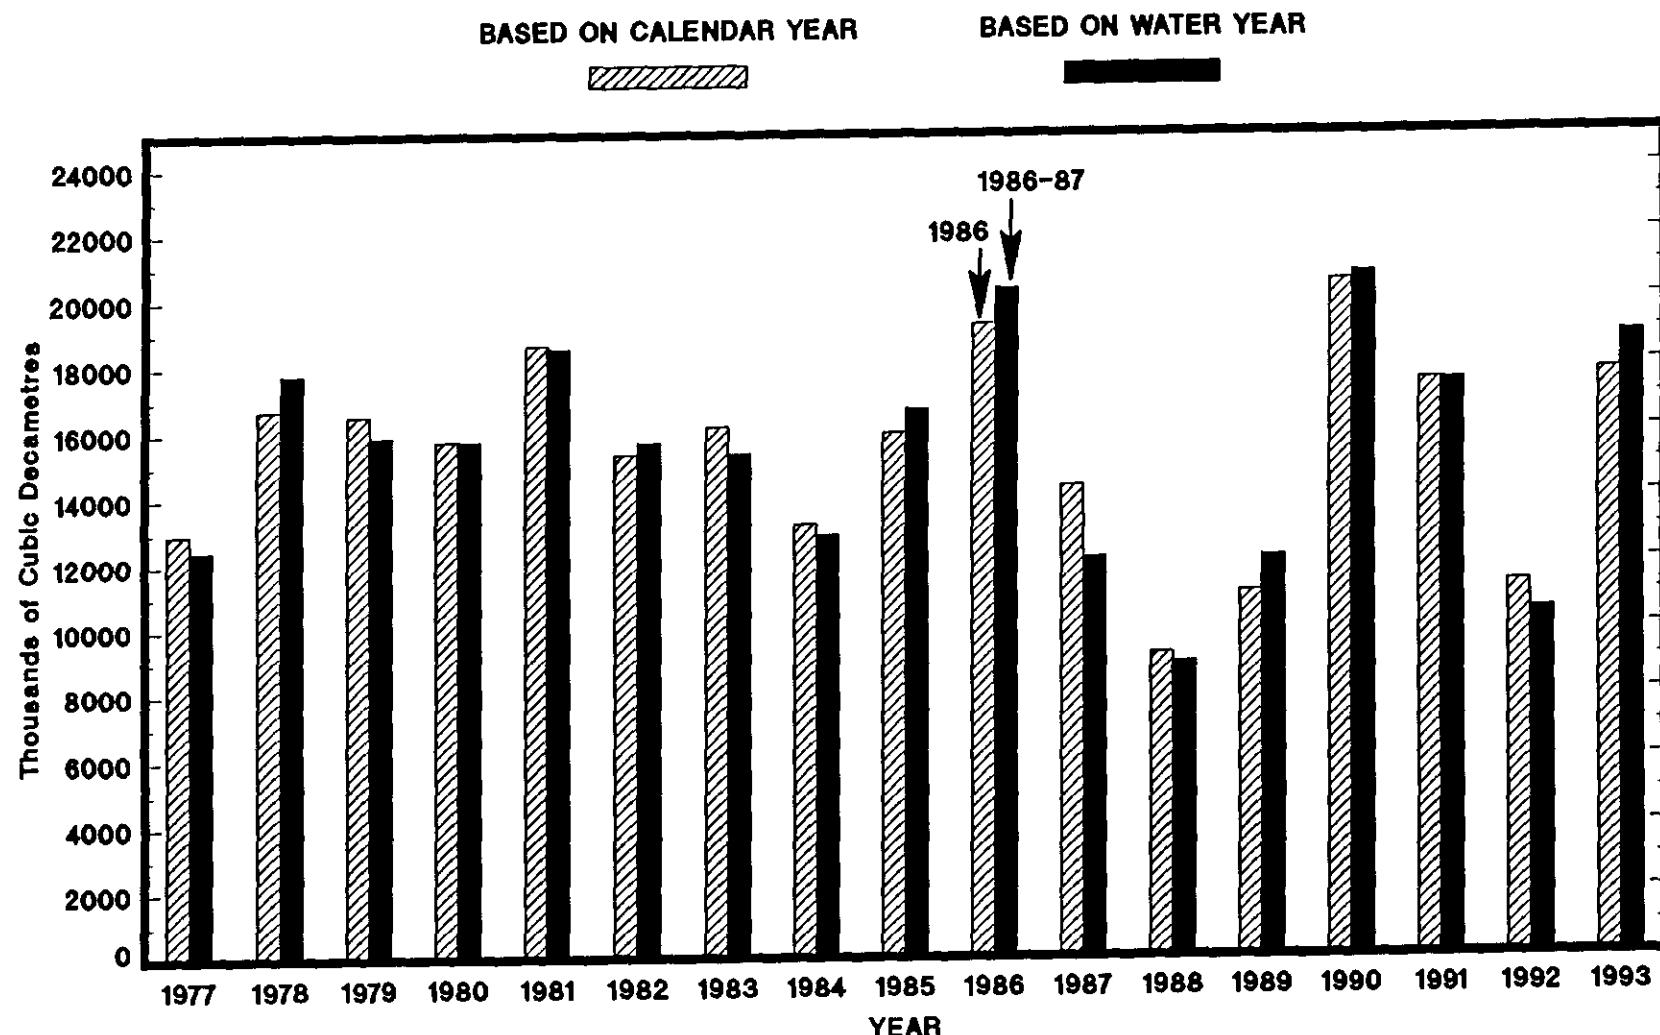

## **CONCLUSIONS**

The calendar year has proved to be a more effective, practical and consistent approach for apportionment monitoring of all eastward flowing interprovincial streams. Adoption of this approach would simplify the process of data evaluation, natural flow computation, apportionment administration and publication of apportionment balance results.

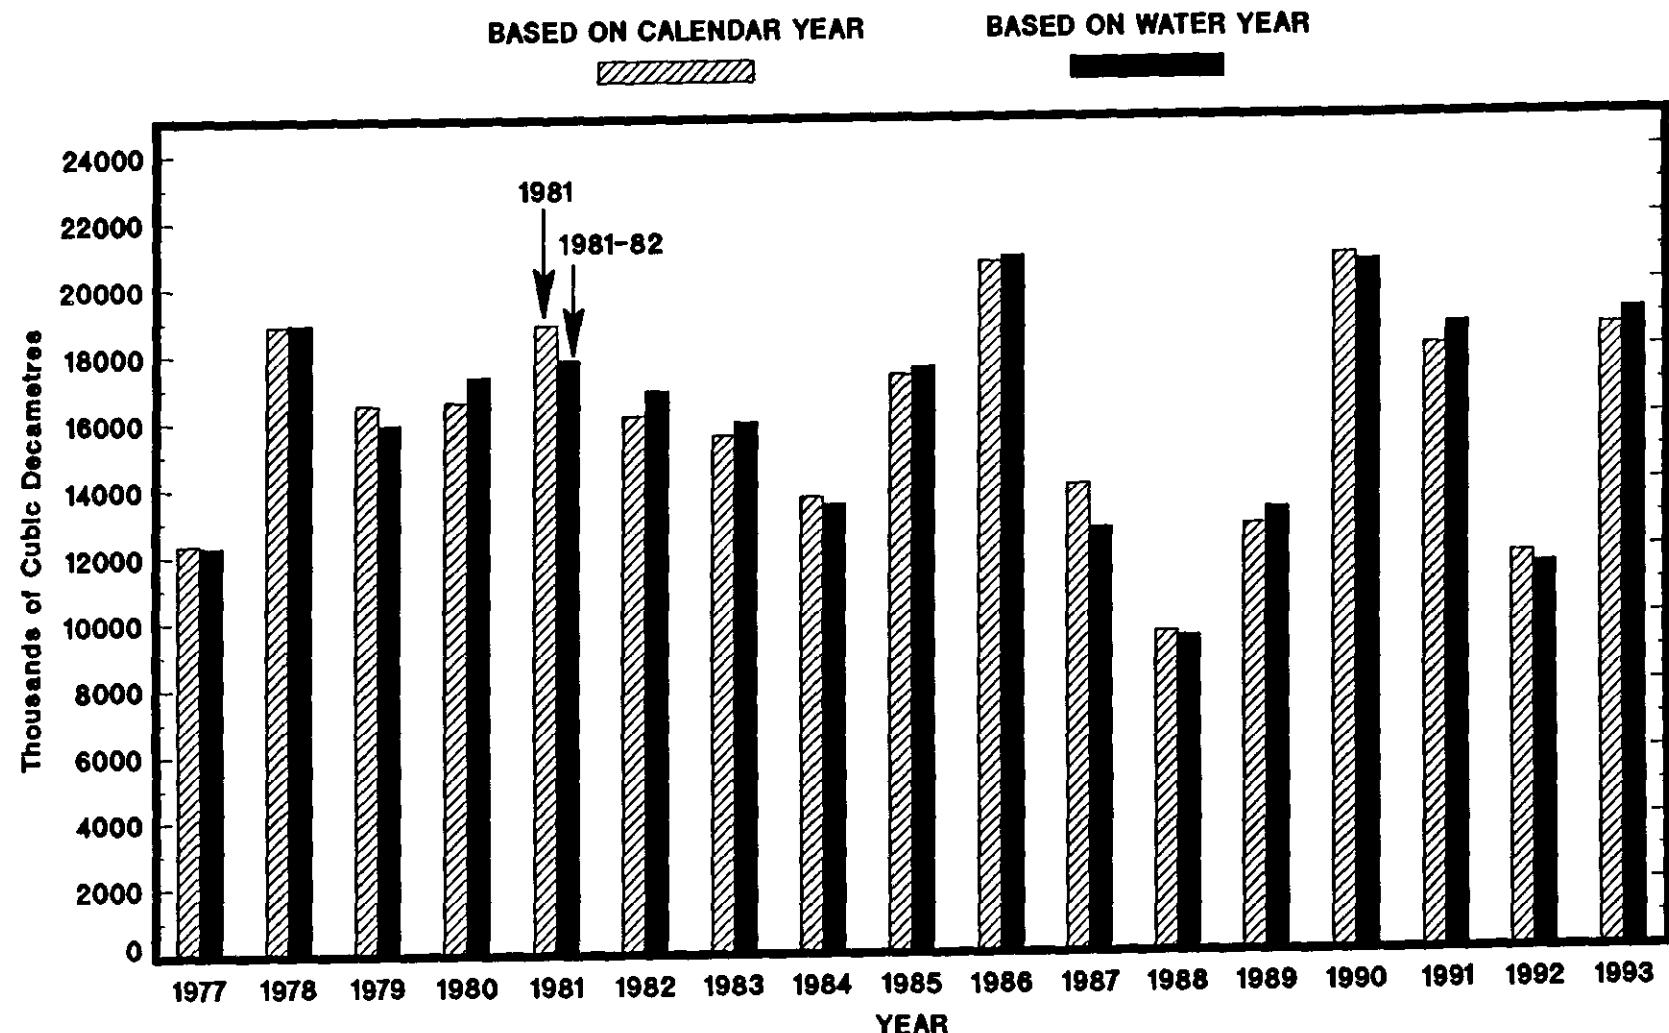

## **RECOMMENDATIONS**

The Committee on Hydrology recommends that Section 3 of Schedule B of the Master Agreement on Apportionment be revised to change the apportionment period from the water year to the calendar year.
